

Seasol Applications

POST-HARVEST

Post-harvest application of Seasol is useful to assist in:

- ✓ Storing energy for the following season
- ✓ Improving nutrient reserves prior to dormancy
- ✓ Helping manage seasonal yield variability
- ✓ Supporting early stress tolerance in the following season.

Energy and nutrient storage in the period between harvest and dormancy can have significant effects on performance in the following season.

Post-harvest Management

Part of the process in maintaining more consistent yields is to keep leaves active as long as possible and to support root growth that occurs during the post-harvest period.

Seasol provides benefits for soil improvement, plant nutrition and stress reduction that can be highly effective in aiding the Post-Harvest management.

Here are some key points to remember when fitting Seasol into an effective post-harvest strategy:

- 1. Don't delay.** The time between harvest and dormancy can be short or highly variable.
- 2. Post-harvest Leaf Activity** is important for energy and nutrient storage to help support early growth & stress tolerance in the following season.
- 3. Root System Activity.** An important root growth flush occurs after harvest in many tree and vine crops.
- 4. Soil application.** Seasol via the irrigation will provide a strong root growth stimulus needed at this time.

APPLICATION RATES & TIMING

STAGE	RATES
Prior to dormancy – while leaves are still green	Seasol via irrigation @ 10L/Ha
